**FOR IMMEDIATE RELEASE**

## **Wireless Tank Monitoring System available from Pneumercator**

Farmingdale, NY. – Pneumercator, a New York based company with over 95 years of experience in the manufacturing of liquid level control equipment now offers wireless tank monitoring for underground and aboveground tank applications with heights from 6” for sub-base tanks to 70’ tall bulk tanks, containing standard motor and aviation fuels, all alternative fuels including E-85 and DEF, corrosive chemicals, waste fluids, lubricants and potable water. Providing inventory management and secondary containment leak detection, the TMS Wireless System helps you to manage your fueling business with accurate real time fuel level information and stay in compliance with federal and state environmental regulations.

The TMS wireless system offers a reliable alternative to implement inventory management and secondary containment leak detection where it is impossible to install a wired system because of site restraints or the expense of installing a wired system is cost prohibitive. It is easy to install, very cost effective and robust even in the most severe and harsh environments. The TMS Wireless System gives you the ability to monitor tanks that are across the street from your office or monitor tanks where there are obstructions that would prevent digging or trenching to lay conduit and run wires. The TMS2000W Wireless system will allow tank owners to add ATG capability to their sites where they might have otherwise had to wait until they were planning a complete upgrade of their tanks and facility.

Besides the installation flexibility the TMS wireless system features real-time continuous readings, extended battery life up to 4 years, a rugged, robust construction for mounting the system outside even in the most extreme temperatures and harsh environments, and no hidden maintenance fees like you might find with other wireless systems. And now, the TMS2000 Wireless System can control up to 12 tanks and 40 external sensing devices for greater control over the management of your site. The TMS Wireless System allows you to decrease your costs, optimize your information control and improve your productivity optimizing your equipment uptime. It also allows you to improve your competitiveness improving the quality of service you provide and increasing customer satisfaction.

The TMS Series Tank Gauge System helps tank owners manage their businesses more effectively and improve productivity, by providing local and remote access to their fuel data twenty-four hours a day, seven days a week. The systems are used extensively in applications for stand-by generators, bulk storage, commercial fueling, airport fueling and industrial fluid storage. Remote data access is available through any computer loaded with Pneumercator’s free TMSComm Software™. TMSComm not only lets operators access their data from a central computer via RS 232, phone or Ethernet connections but it also lets them securely control and modify system configurations and diagnose problems.

Pneumercator [<http://www.pneumercator.com>] is a leading supplier of automatic tank gauging and liquid level control systems, with a tradition of excellence in the commercial and industrial liquid level control industry. Pneumercator is headquartered in Farmingdale, New York. Contact Pneumercator at 800-209-7858 for more information.
